INTRODUCTION

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established under the direction of the Environmental Protection Agency's Office of Toxic Substances Survey and Analysis Division. This centralized resource of body-burden information has grown out of the concern of government scientists over continuing reports of toxic chemicals in human tissues and body fluids. These two volumes are the first annual publication of the data base.

Body burden is a reflection of exposures to food, air, and water contaminants, as well as pharmaceutical administration. The systematic acquisition of body-burden data will facilitate a more relevant assessment of human exposure to xenobiotics (including toxic chemicals) than previously possible using environmental contamination levels.

Data were obtained primarily from the open literature through manual searches of the 84 journals listed in Appendix A. Retrospective searching to 1974 yielded over 2000 pertinent documents of which approximately 440 have been entered into the data base to date. Over 200 chemicals were identified in human biological media from these sources and are listed by CAS Registry Numbers and Preferred Names in Appendix B. (For the user's convenience, cross-referenced chemical lists of CAS names are provided in Appendix C.) A list of the human tissues and body fluids found to be contaminated by these chemicals is presented in Appendix D.

Contacts with various federal agencies and private investigators have been initiated in an effort to identify additional sources of body-burden data. For instance, arrangements are underway to provide for the inclusion of data gathered under the National Human Monitoring Program of the Office of Toxic Substances. Preliminary efforts at contacting foreign researchers have also been undertaken.

The data base will be published annually in tabular format with four indices for specific searching. A limited number of custom searches of the data base will be available in special cases when the published format does not allow for retrieval of needed information. It should be emphasized that the purpose of the data base is to provide a centralized resource for body-burden data and in no way is intended to obviate the

need for the user to ultimately refer to the original literature or data source. It is not the intent of this program to conduct any screening or evaluation of the data it contains.

This data base has been established under the aegis of the Inter-agency Collaborative Group on Environmental Carcinogenesis (ICGEC), National Cancer Institute. The work is being done by the Oak Ridge National Laboratory's Health and Environmental Studies Program, Information Center Complex, through interagency agreements involving the National Cancer Institute, the Environmental Protection Agency, and the Department of Energy. Members of the ICGEC task group on Chemicals in Human Tissues provided support by regular reviews of the program activities. Agencies represented by members of the task group included: the Armed Forces Institute of Pathology, the Center for Disease Control, the Department of Agriculture, the Environmental Protection Agency, the Food and Drug Administration, the National Bureau of Standards, the National Cancer Institute, the National Center for Toxicological Research, the National Institute for Environmental Health Sciences, the National Institute for Occupational Safety and Health, and the National Library of Medicine.

This activity is still in the developmental stage, and modifications are regularly being made as deemed appropriate. As this document is utilized, it is anticipated that additional improvements will be identified by various users. Feedback, particularly critical comments, is invited. To insure that your input is received and to obtain additional information about the data base and/or searchers thereof, contact:

USER'S GUIDE

Of the over 2000 body-burden documents collected, data from approximately 440 have been entered into the data base as of October 1979. The emphasis to date on inputting recent literature and significant research documents has resulted in a chronological mix of articles from 1974 to the present. It is anticipated that by the time of the second annual report publication, the majority, if not all, of the collected documents will be in the data base.

When body-burden articles are identified, data are extracted and entered in the data base by chemical and tissue/body fluid. Each data entry comprises a single record (or line entry) and is assigned a record number. If a particular document deals with more than one chemical and/or tissue, there will be multiple records for that document. For example, a study of 5 chemicals in each of 3 tissues would have 15 different records (or 15 line entries) in the data base with 15 record numbers. Record numbers are assigned consecutively throughout the data base and appear in the upper left corner of the tissue column for each record.

Part 1 contains introductory material, references, appendices, indices, and a chemical directory. Part 2 contains the data base. The data base is presented in tabular form and arranged alphabetically by CAS Preferred Chemical Name. The following sample record (see p. 4) illustrates the tabular format. The chemical, in this case arsenic, is given along with its CAS Registry Number, formula, atomic weight, melting point, boiling point, and vapor pressure. Tissues are listed alphabetically in the first column with the record number. In the sample record, the tissue is hair and record number is 5.

Information in the next five columns — exposure route, analytical method, number of cases, range, and mean — is self-explanatory and is provided when available in the source document. A list of abbreviations used for analytical techniques is provided on page 7. Exponential values are written as follows: 5×10^{-15} is 5 x 10(E-15). All means are arithmetic unless designated geometric. Documents have been summarized when only graphically displayed data were available; they have been estimated by the extractor and so indicated in the table under general information.

In the column headed general information, a variety of information may be included such as that pertinent to the range and mean as well as experimental design, demography, health effects, pathology, morphology, toxicity, source, half-life, and use. In general, all supporting information deemed important for understanding the data presented will appear in this column.

Since all details of the research cannot be offered in this publication, keywords, in uppercase letters, are provided for further insight into important aspects of the source documents. The use of a different chemical as a keyword would indicate that studies on that chemical were also reported in the same document. For example, CADMIUM may appear as a keyword in a record on MERCURY when the research includes work on both chemicals. In the same way, a different tissue occurring as a keyword would indicate that the document had also dealt with that tissue.

Review articles are included in the data base; however, no data have been extracted from such documents since the original research articles are included. They are designated in the general information column by the word "Review."

Generally, the CAS names are from the *Ninth Collective Index*, and in some cases, names from both the eighth and ninth collective indices are given. Appendix C provides cross-referenced alphabetical lists of commonly used synonyms paired with the CAS Preferred Names. For accessing information in the data base when only the CAS Registry Number is known, the user would refer to Appendix B which lists CAS Registry Numbers coupled with preferred names. To help in locating chemicals in the tabular portion of the document, an alphabetically arranged directory of chemicals referenced by CAS Names and Record Numbers is provided at the end of Part 1. Indices to the data base are provided by author, corporate author, tissue or body fluid, and keywords, and refer the user to the appropriate record number(s). References from the data base, as well as sources for the physical and chemical data, are also listed in Part 1.

OFFICE OF TOXIC SUBSTANCES

MEMORANDUM

SUBJECT: "Chemicals Identified in Human Biological
Media, A Data Base"

FROM: Cindy Stroup, Biologist
OPTS/OPII/SAD (TS-793)
Environmental Protection Agency *C Stroup*

TO: Recipients of First Annual Report

The enclosed document is the product of an interagency effort involving the National Cancer Institute, the Environmental Protection Agency, and the Department of Energy. The need for a centralized source of body-burden information was recognized several years ago by government scientists concerned about continuing reports of toxic chemicals in human tissues and body fluids. Subsequently, a program to develop a body-burden data base was initiated under the aegis of the Interagency Collaborative Group on Environmental Carcinogenesis under the Chairpersonship of Dr. Herman S. Kraybill of the National Cancer Institute.

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established under the direction of the Environmental Protection Agency Office of Pesticides and Toxic Substances' Survey and Analysis Division. Data were obtained primarily from manual searches of the open literature back to 1974. Of over 2,000 documents collected during the first year of the program, approximately 350 have been entered into the data base to date. Over 200 chemicals were identified in human biological media from these sources. Dr. Kraybill serves as the NCI Co-Project Officer on this program.

Since, to our knowledge, this is the only program of its kind and due to the keen interest in human body burden, we are attempting to provide wide distribution of this first annual report. Copies are being sent to members of the following government groups:

DHEW Committee to Coordinate Environmental
and Related Programs
NCI Interagency Collaborative Group on
Environmental Carcinogenesis (ICGEC)
ICGEC Task Group on Chemicals In Human Tissues

In addition, copies are being sent to US medical schools and schools of public health.

All recipients are sincerely urged to review the document and provide the EPA Project Officer with appropriate comments. It is our intent to publish annual reports that will be sequential, but not cumulative. Your suggestions on how we might improve particular aspects of the data base to insure maximum possible utility for the majority of users would be very much appreciated. If there are individuals or groups that should or would like to be added to our mailing list, please provide their names and addresses as soon as possible to:
